

Anatomical Admin Defaults – QRC 0.3

Points to Remember

- The Anatomical Admin Site Defaults are an optional process where the preferred sites of administration can be identified for some or all vaccines.
- Defaults may be changed at any time by the user. Additionally, when documenting an immunization, the user can select a different value other than the default simply by clicking on the field and selecting a different value.
- The Minimum Age and Maximum Age defaults are designed for setting immunization defaults for young children. If the default should apply to older children and adults, leave the maximum age field blank.
