

Immunization Override – QRC 2.0

Panorama Quick Reference Card

Points to Remember

- Any immunizations that do not meet the forecaster rules are marked as invalid in Panorama. Invalid doses are displayed with an 'X' mark in the immunization date in the **Immunization History- Summary Grid** table.
- If you agree with the Forecaster designation of an administered dose as invalid, and the stated rationale, no changes or action on the part of the user will be required.
- If you disagree with the Forecaster assessment that an administered dose is invalid, do not use the Forecaster assessment of a client immunization status to determine future doses for the vaccine until the issue is resolved (follow the NS policy to obtain a second clinical opinion if required).
- Immunization status may be changed manually from Valid to Invalid, and from Invalid to Valid.
- When changing the status to Invalid, and the **Status Change Reason** is **Other**, the user is required to enter a comment in the **Status Change Reason Other** text box. If selecting a different **Status Change Reason**, an optional comment may be added in the **Comments** section at the bottom of the **Update Immunization** screen.
- It is best practice to add a comment when overriding immunization status.
- Each time an immunization status is updated, the reason is documented in the **Comments and Status Updates** section.
