

Panorama Tips & Tricks # 29

Latent Tb Infection – Classification, Disposition and Staging

LTBI can be reported to Public Health through medical surveillance follow up or by a health care provider. Both situations are captured in Panorama but need to be inputted as a LTBI infection so that they are not captured as an active TB case when Tuberculosis numbers are counted.

Please see below on how to properly capture LTBI infections

	Classification	Disposition	Staging
Med Surveillance	Case person under investigation or Case-case confirmed Case- not a case Change as investigation progresses	Medical Surveillance	LTBI* *If they are identified as a case of LTBI through process
LTBI that did not originate from a Medical Surveillance Example: call from a doctor to see about help with medication cost for a LTBI case	Case-case confirmed	Completed no further action	LTBI
